

# Video Quality Check

## Tutorial for QA Operators

---

Thank you for joining us as a QA tester. You are here to help with **developer testing** of our QA annotation app.

We are collecting first-person videos of people doing real household and work tasks (cooking, cleaning, repairing, etc.) to teach robots how humans work. The camera is mounted on the person's head, so we see what they see.

**Your job:** watch these videos and decide whether each one is good enough for a robot to learn from. You watch, you decide Yes or No, you tap Completed, and you move on.

Try to do at least **30+ minutes per session**. You can watch at 2x speed. If a video is clearly good, scrub forward and approve it quickly.

# Setting Up the App

## Step 1

### Download the App

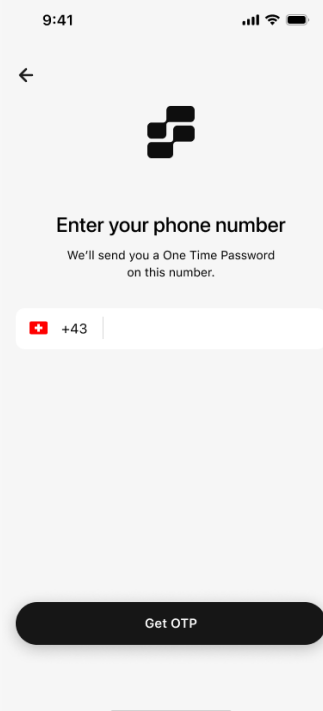

Go to the website link you were given. Download the APK file to your Android phone. Your phone will show security warnings. **Tap Allow and Yes to everything.** The file is safe.

## Step 2

### Open and Register

Open the app and enter your phone number. You will be asked for an OTP code.

**OTP for dev testing: enter 123456**

9:41

←

Enter your phone number

We'll send you a One Time Password on this number.

+43

Get OTP

### Step 3

#### Fill in Your Details

Enter your name, email (optional), phone number, and height. Check the Terms & Conditions box, tap Accept, then tap Done.

9:41

#### Finish Sign Up

Please fill in your details

Full Name

Email (optional)

+43

Phone Number

Height

☐ I accept the Terms & Conditions

Done

### Step 4

#### Enter the Partner Code

You will see a screen asking for your partner code. Type in the code shown to the right. You may need to **tap the button twice** for it to register.

**FATIH1**

9:41

#### Enter your partner code

Our partner will provide you with a code

Ex. A35C73

Verify

### Step 5

#### **Skip Recording. Go Straight to Video Tasks.**

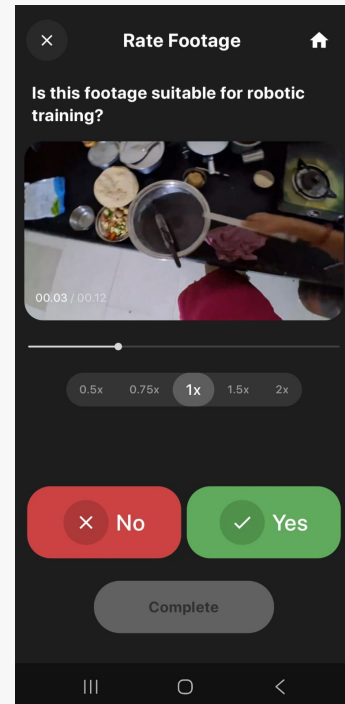

**Do NOT record any videos.** You do not have a head strap. Instead, find and tap on the **Video Tasks** section in the app.

### Step 6

#### **Complete the In-App Tutorial**

The app will show a quick tutorial. Go through all of it. It explains the different task types. You will be doing **Video Quality Check** (task type 4). Read the next pages of this guide carefully as well.

Once you start reviewing, you will see a screen like the one shown here. Watch the video, then tap **No** (red) or **Yes** (green), followed by **Complete**.

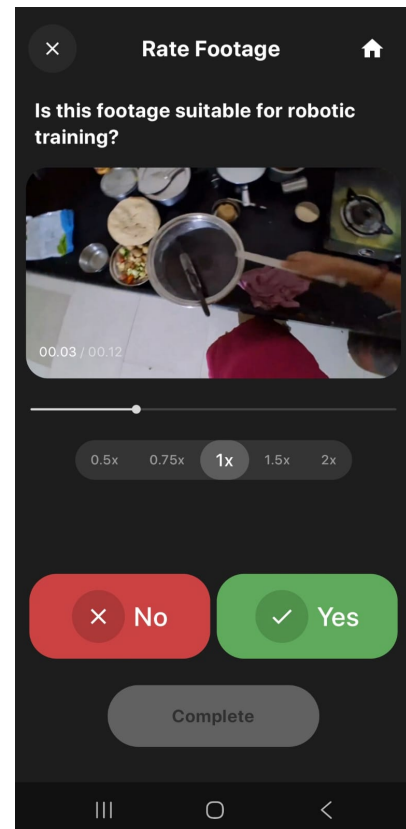

## How the Video Check Works

When you open a Video Quality Check task, the app shows you videos one at a time. For each video, you answer one question:

**Is this a real, useful task that a robot could learn from?**

You can adjust playback speed (0.5x to 2x) and scrub through the video. Then tap the red **No** or green **Yes** button, followed by **Complete**.

The app asks you to check three things:

1. **Is there a clear task?** The video should show someone doing a real activity with a clear goal. Not just walking around, sitting, or staring at a screen.
2. **Can you follow it?** The hands and actions should be easy to see. If you cannot tell what the person is doing, it is a bad video.
3. **Would it be useful for a robot?** Could a robot learn something practical from this? Cooking, cleaning, repairing, building, organizing: **yes**. Drinking coffee, reading, scrolling a phone: **no**.

After you decide, tap **Yes** (good video) or **No** (bad video), then tap **Completed**. Move to the next one.

### Speed Tips

You can watch at 2x speed. If a video looks clearly good from the start, scrub forward to confirm and approve quickly. If something feels off, keep watching to

be sure, then reject. **When in doubt, lean toward No.** It is better to lose a borderline video than to keep a bad one.

## When to Tap “No” (Reject)

---

If you see **any** of these problems, reject the video.

### **✗ Not a Robot-Worthy Task**

*Most important rule*

The task must be something a robot could realistically do and learn from. Ask yourself: does this bring economic value, or does it help around the house?

✓ Cooking, cleaning dishes, repairing things, doing laundry, organizing shelves

✗ Reading a book, writing notes, drinking coffee, scrolling a phone, watching TV

Also consider whether the task is modern enough. For example, hand-washing clothes in buckets is a real chore, but it is not how a modern robot would do laundry. For collections from Indian homes, we primarily expect **cooking and cleaning tasks**.

### **✗ Fake or Staged Task**

This is a huge problem. Some people fake tasks to get paid. Examples: wiping a plate that is already clean for two minutes straight, transferring water between bottles back and forth for no reason, carrying the same item from one spot to another repeatedly, opening and closing drawers with no purpose. If the task looks pointless or made up, reject it.

### **✗ Just Walking, Idling, or Doing Nothing**

If the person is just walking around, standing still, sitting, or there is no actual task happening, reject it. The video needs to show someone actively doing something useful with their hands.

### **✗ Recording a Screen or Monitor**

Some people point the camera at a TV, computer, or phone screen instead of doing a real task. **Pay extra attention to this:** if you see another monitor or screen visible anywhere in the video, the person may be recording someone else’s footage off a display. This is a common scam. Reject immediately.

### **✗ Camera Not on the Head**

The camera must be head-mounted so we see through their eyes. If someone else filmed them, or they set the camera down facing themselves, or they are holding the phone in their hand, reject it.

### **✗ Terrible Camera Angle**

Even if the camera is on the head, the angle might be useless: pointing at the ceiling, pointing at the floor, rotated sideways. If you cannot clearly see what the hands are doing, reject it.

### **✗ Too Dark, Blurry, or Unwatchable**

If you cannot make out what is happening, reject it.

### **✗ Too Short**

Very short clips (under 10 seconds) with no meaningful action should be rejected.

## **When to Tap “Yes” (Accept)**

---

A good video has **all** of these:

### **✓ A Real Task That Has Value**

The person is doing something concrete and useful: cooking a meal, washing dishes, repairing a machine, sorting items, cleaning a surface, assembling parts, gardening. Real work that a robot could learn from.

### **✓ Hands and Actions Are Clearly Visible**

You can see what the person’s hands are doing. The actions are clear and you can follow along.

### **✓ First-Person View from the Head**

The camera is on the person’s head. You see things from their point of view, as if you are looking through their eyes.

### ✓ **Good Enough Angle and Lighting**

You can clearly see the task area. Not sideways, not too dark, not pointed at the ceiling. It does not need to be perfect. Just clear enough to understand what is happening.

### ✓ **Long Enough to Be Useful**

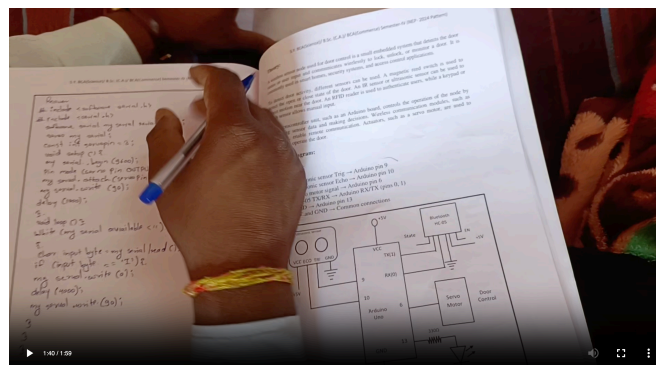

The video is long enough (more than 10 seconds) to show a real chunk of work being done.

**When in doubt, tap No.** It is always better to reject a questionable video than to approve a bad one.

## Real Examples

Here are screenshots from actual videos to help you see what to look for.

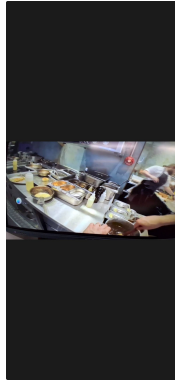

### ✗ **REJECT: Not a robot-worthy task**

The person is reading a textbook and writing notes. This is not a task a robot would do. It has no practical or physical value for robot training. Always reject reading, writing, and studying.

### ✗ **REJECT: Complete scam**

Look closely: there is another monitor visible in the frame. The person is not actually performing a task. They are recording someone else's video off a screen. This is a common trick. Also notice the terrible camera angle with heavy letterboxing (huge black bars on top and bottom). **Pay close attention to any video where you can see a monitor, TV, or second screen in the shot.** Reject immediately.

✗ **REJECT:** Not a modern, robot-relevant task

Head-mounted camera, and the person appears to be washing clothes by hand in buckets. While laundry is a real household task, this is not how a modern robot would do laundry. We are not training robots to hand-wash clothes in buckets. For collections from Indian homes, we primarily expect **cooking and cleaning tasks**. If the task is too primitive or not something a robot would realistically replicate, reject it.

## Quick Reference

---

For every video, ask yourself these three questions:

| Question              | Yes (Accept)                                                | No (Reject)                                                                                               |
|-----------------------|-------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|
| Is there a real task? | Cooking, cleaning, repairing, building, organizing, sorting | Walking around, sitting idle, reading, drinking coffee, watching TV, scrolling phone                      |
| Can I clearly see it? | Hands visible, actions clear, decent angle, well-lit        | Too dark, sideways, ceiling/floor angle, blurry, cannot follow                                            |
| Is the task genuine?  | Natural, purposeful actions with a clear goal               | Wiping clean plates, moving water between bottles, carrying nothing back and forth, recording a TV screen |

### Your workflow:

Watch video → Decide → Tap Yes or No → Tap Completed → Next video

### Thank you for your help.

Every video you check makes a difference.

Try to do at least 30 minutes per session.

*If you have any questions, reach out to whoever sent you this guide.*
